

Antimicrobial features & benefits

Promessa AV is engineered with EPA registered technology to inhibit growth of microorganisms and other surface pathogens. Ultraleather Pro and Ultraleather Linen also have the same technology, to provide a cleaner, safer, healthier environment.

Ultraleather Linen | Ultraleather Pro | Ultraleather Promessa AV

Silver ions pass through the cell walls.

Silver ions stop respiration, which stops energy from being produced for the cell.

Silver ions interact with the DNA to inhibit cell division which in turn stops replication.

The inherent antimicrobial protection, a silver ion-based agent, prevents the growth of both gram-positive and gram-negative bacteria. Since silver ions do not readily evaporate nor dissolve the efficacy will be long-lasting. Silver ions are not to be confused with nano-silver which has been shown to leach out, contaminating other surfaces and can be absorbed into the human body. Additionally, the added protection does not contain Tricolsan or Triclocarban.

The metallic ion structure of the antimicrobial agent is approved for applications including textile use and specifically polycarbonate polymers and is registered by the US EPA (Environmental Protection Agency).

Ultrafabrics® antimicrobial collections are tested to ASTM E2180 and/or AATCC 147 to evaluate the antibacterial effectiveness of agents incorporated or bound into or onto mainly flat hydrophobic or polymeric surfaces. Our outdoor collections that include an anti-mildew agent are tested to ASTM G21; a method designed to evaluate the fungal resistance of plastics and polymeric materials.

Note: One of the best ways to keep Ultrafabrics looking great and germ-free is through proper maintenance. Antimicrobial protection does not replace regular cleaning and disinfection. Please visit our website for a full list of approved cleaners disinfectants.
